The invention relates to an antisense compound (I) 8-30 nucleobases in length targeted to a nucleic acid molecule encoding lysophospholipase I (II), where (I) specifically hybridises with and inhibits the expression of (II) is useful for inhibiting the expression of (II) in cells or tissues, and for treating a human having a disease or condition associated with Lysophospholipase I e.g. inflammation, hyperlipidemia, and cardiovascular disorders such as atherosclerosis and myocardial ischaemia. (I) is useful as research reagent and diagnostics. (I) is also useful for distinguishing functions of various members of a biological pathway. (I) is useful in antisense gene therapy. ABK37028-ABK37191 represent lysophospholipase I coding sequences, antisense oligonucleotides and related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   335
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         515
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for identifying tumour characteristics, comprising measuring a copy number or expression level cof at least two genes associated with lipid metabolism, synthesis, or action in cells from a patient tissue sample, and comparing the results with a copy number or expression level of the genes in a normal cell. This described is an array of nucleic acid polymers in a normal cell. Cell support, comprising a solid support at least two different nucleic acid polymers which are each specific for a different gene associated the inpid metabolism, synthesis or action, where each nucleic acid polymer is located at a predetermined position on the solid support, and the array comprises nucleic acid polymers which are specific for less than 100 genes other than the selected genes. The method is useful for the array comprises nucleic acid polymers which are specific for less than 100 genes other than the selected genes. The method is useful for determining tumour characteristics in a tissue sample taken from a patient. The present sequence represents a human lipid-associated gene related CDNA sequence, which is used in the exemplification of the

                                                                                                                                                                                                               This invention describes novel cytostatic polynuclectide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer. C or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in prostatic tissue. Screening for inhibitors of the sequences or detection c substances involves a binding assay, any compounds that bind are selected, optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, control therefore the prospected of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, espectification and program and program and antibody (Ab) against the optimal partial propression and antibody (Ab) against the optimal antibody directed against Ab or any of the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymucleotides are identified in human prostatic cancer by differential expression analysis, using DNA microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that copy quantitative PCR. Analysis of prostatic cancer samples showed that prostatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated from prostatic adsocond antibody, streptavidin-conjugated horsersadish pervands membrane and cytoplasmic staining was very strong, and polymention manalysis of framer (or amples were counterstained with hemalum (blue) or the prostatic cancer 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel cytostatic polynucleotide and polypeptide sequences which can be used in a method for diagnosing prostatic cancer or the risk of developing prostatic cancer. Diagnosis is based on determining over transcription or over expression of the sequences in

protective tissue. Sicienting 101 initializes of the reporter indicates the presence of selected optionally after deconvolution of mixtures. Detection of a predetermined minimum level of the reporter indicates the presence of tumour cells. Inhibitors can be chosen from antisense oligonucleotides, tumour cells. Inhibitors can be chosen from antisense oligonucleotides, short-interfering RNA or ribozymes; an organic molecule of molecular captamer against the polypeptide; an organic molecule of molecular or apteamer against the polypeptide; an antibody (Ab) against the polypeptide; an antibody delected against the polypeptide; an antibody delected against the polypeptide; and antibody delected against the polypeptide; and antibody delected against the above derivatised with a reporter group, cell toxin, immunostimulatory molecules and/or radioisotope. The polymucleotides are identified in human prostatic cancer publicate expression analysis, usund microarrays, between normal and tumorous tissues, with (over) expression being detected by quantitative PCR. Analysis of prostatic cancer samples showed that correct patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated from prostatic cancer patients, or subjects at risk, were incubated continulated second antibody; streptavidin-conjugated horseradish certoridase and then diaminoberzidine as colour former (brown). The samples were counterstained with hemalum (blue). Malignant cells stained strongly but non-malignant cells only weakly. In 15 of 61 samples of adenocarcinoma, membrane and cytoplasmic staining was very strong, and lymph node metaatases were also staining was very strong, and continue of polymucleotide and polypeptide sequences used in the method of the
sequences or detection

New nucleic acid differentially expressed in pancreatic tumor tissue, for use as diagnostic agents and in screening for therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel human nucleic acid sequence of the pancreas and its encoded protein. The invention further comprises: proteins and peptides, perferably isolated, that contain a sequence encoded by the novel nucleic acid; and methods for diagnosis and treatment of pancreatic cancer, using a substance that inhibits or binds to the protein or its DNA, including; an antisense oligonucleotide, short interfering RNA or ribozyme directed against the pancreatic protein, an organic molecule, particularly having a molecular weight below 5000, especially 300, that binds to the pancreatic DNA, an aptamer or (monoclonal) antibody, perferably human or humanized, that binds to the pancreatic DNA, or an anti-idotypic antibody raised against the monoclonal antibody, any of which may be derivatized with a reporter
                  Pancreatic cancer associated human protein encoding DNA, SEQ ID 19

Y ...

group, cytotoxic compound, immunostimulant and/or radioisotope. The novel human pancreatic proteins and their encoding DNA have cytostatic activity. The novel sequences are useful for inhibiting transcription and/or expression of genes and proteins associated with pancreatic cancer. This polynucleotide sequence represents the DNA encoding one of the novel human pancreatic proteins of the invention. Note: This sequence is not shown in the specification, it has been electronically downloaded from a DVD-rom provided with this specification by the European Patent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360
                                                                                                                                                                                                                                                                                                                                                                                                                             called human colon cancer antigens, given in AABS3234 to AABS4006. The human colon cancer antigens can have cytostatic, cardioactive, muscular, neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptide or opposition of cancer in holypeptides; expression vectors and host cells comprising a TAT nucleic acid, an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide, and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful
                                                                                                                                     9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             254
for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be chromosome identification probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acid of the invention

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-09-493-601B-1
